

1-9 Introduction to Parent Functions

Starter 1.9 **HW 1.8???**

1. For the power 3^5 , identify the exponent and the base. **exponent: 5; base: 3**

Evaluate.

2. $\left(\frac{2}{3}\right)^{-2} \frac{9}{4}$

3. $f(9)$ when $f(x) = 2x + \sqrt{x}$ **21**

1-9 Introduction to Parent Functions

Parent function—the simplest function with the defining characteristics of the family. Functions in the same family are transformations of their parent function

1-9 Introduction to Parent Functions

Parent Functions					
Family	Constant	Linear	Quadratic	Cubic	Square root
Rule	$f(x) = c$	$f(x) = x$	$f(x) = x^2$	$f(x) = x^3$	$f(x) = \sqrt{x}$
Graph					
Domain	\mathbb{R}	\mathbb{R}	\mathbb{R}	\mathbb{R}	$x \geq 0$
Range	$y = c$	\mathbb{R}	$y \geq 0$	\mathbb{R}	$y \geq 0$
Intersects y-axis	$(0, c)$	$(0, 0)$	$(0, 0)$	$(0, 0)$	$(0, 0)$

1-9 Introduction to Parent Functions

Helpful Hint

To make graphs appear accurate on a graphing calculator, use the standard square window. Press **ZOOM**, choose **6:ZStandard**, press **ZOOM** again, and choose **5:ZSquare**.

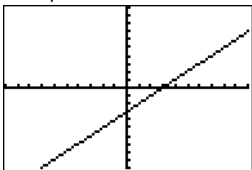

1-9 Introduction to Parent Functions

Example 1A: Identifying Transformations of Parent Functions

Identify the parent function for g from its function rule. Then graph g and describe what transformation of the parent function it represents.

$g(x) = x - 3$

$g(x) = x - 3$ is linear x has a power of 1.

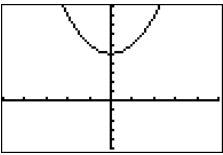

1-9 Introduction to Parent Functions

Example 1B: Identifying Transformations of Parent Functions

Identify the parent function for g from its function rule. Then graph and describe what transformation of the parent function it represents.

$g(x) = x^2 + 5$

$g(x) = x^2 + 5$ is quadratic. x has a power of 2.

1-9 Introduction to Parent Functions

Check It Out! Example 1a

Identify the parent function for g from its function rule. Then graph and describe what transformation of the parent function it represents.

$g(x) = x^3 + 2$

$g(x) = x^3 + 2$ is cubic. x has a power of 3.

1-9 Introduction to Parent Functions

Check It Out! Example 1b

Identify the parent function for g from its function rule. Then graph and describe what transformation of the parent function it represents.

$g(x) = (-x)^2$

$g(x) = (-x)^2$ is quadratic. x has a power of 2.

1-9 Introduction to Parent Functions

It is often necessary to work with a set of data points like the ones represented by the table below.

x	-4	-2	0	2	4
y	8	2	0	2	8

With only the information in the table, it is impossible to know the exact behavior of the data between and beyond the given points. However, a working knowledge of the parent functions can allow you to sketch a curve to approximate those values not found in the table.

1-9 Introduction to Parent Functions

Example 2: Identifying Parent Functions to Model Data Sets

Graph the data from this set of ordered pairs. Describe the parent function and the transformation that best approximates the data set. $\{(-2, 12), (-1, 3), (0, 0), (1, 3), (2, 12)\}$

x	-2	-1	0	1	2
y	12	3	0	3	12

The graph of the data points resembles the shape of the quadratic parent function $f(x) = x^2$. The quadratic parent function passes through the points (1, 1) and (2, 4). The data set contains the points (1, 1) = (1, 3(1)) and (2, 4) = (2, 3(4)).

The data set seems to represent a vertical stretch of the quadratic parent function by a factor of 3.

1-9 Introduction to Parent Functions

Check It Out! Example 2

Graph the data from the table. Describe the parent function and the transformation that best approximates the data set.

x	-4	-2	0	2	4
y	-12	-6	0	6	12

The graph of the data points resembles the shape of the linear parent function $f(x) = x$.

The linear parent function passes through the points (2, 2) and (4, 4).

The data set contains the points (2, 2) = (2, 3(2)) and (4, 4) = (4, 3(4)).

The data set seems to represent a vertical stretch of the linear function by a factor of 3.

1-9 Introduction to Parent Functions

Consider the two data points (0, 0) and (0, 1). If you plot them on a coordinate plane you might very well think that they are part of a linear function. In fact they belong to each of the parent functions below.

Linear
 $f(x) = x$

Quadratic
 $f(x) = x^2$

Cubic
 $f(x) = x^3$

Square Root
 $f(x) = \sqrt{x}$

Remember that any parent function you use to approximate a set of data should never be considered exact. However, these function approximations are often useful for estimating unknown values.

1-9 Introduction to Parent Functions

Example 3: Application
Graph the relationship from year to sales in millions of dollars and identify which parent function best describes it. Then use the graph to estimate when cumulative sales reached \$10 million.

Cumulative Sales	
Year	Sales (million \$)
1	0.6
2	1.8
3	4.2
4	7.8
5	12.6

Step 1 Graph the relation.
Graph the points given in the table. Draw a smooth curve through them to help you see the shape.

The graph shows a coordinate plane with 'Year' on the x-axis (0 to 6) and 'Sales (million \$)' on the y-axis (0 to 12). Five points are plotted: (1, 0.6), (2, 1.8), (3, 4.2), (4, 7.8), and (5, 12.6). A smooth curve is drawn through these points, showing a clear upward-curving parabolic shape.

1-9 Introduction to Parent Functions

Example 3 Continued

Step 2 Identify the parent function.
The graph of the data set resembles the shape of the quadratic parent function $f(x) = x^2$.

Step 3 Estimate when cumulative sales reached \$10 million.
The curve indicates that sales will reach the \$10 million mark after about 4.5 years.

The graph is identical to the one in the previous block, showing a parabolic curve on a coordinate plane with 'Year' on the x-axis and 'Sales (million \$)' on the y-axis.

1-9 Introduction to Parent Functions

Check It Out! Example 3
The cost of playing an online video game depends on the number of months for which the online service is used. Graph the relationship from number of months to cost, and identify which parent function best describes the data. Then use the graph to estimate the cost of 5 months of online service.

Cost of Online Video Game					
Time (mo)	1	3	6	9	12
Cost (\$)	40	56	80	104	128

Step 1 Graph the relation.
Graph the points given in the table. Draw a smooth line through them to help you see the shape.

Step 2 Identify the parent function.
The graph of the data set resembles the shape of a linear parent function $f(x) = x$.

Step 3 Estimate the cost for 5 months of online service.
The linear graph indicates that the cost for 5 months of online service is \$72.

The graph shows a coordinate plane with 'Time (mo)' on the x-axis (0 to 15) and 'Cost (\$)' on the y-axis (0 to 150). Five points are plotted: (1, 40), (3, 56), (6, 80), (9, 104), and (12, 128). A straight line is drawn through these points, showing a clear linear relationship.

1-9 Introduction to Parent Functions

Check It Out! Example 3 Continued

Cost of Online Video Game					
Time (mo)	1	3	6	9	12
Cost (\$)	40	56	80	104	128

Step 1 Graph the relation.
Graph the points given in the table. Draw a smooth line through them to help you see the shape.

Step 2 Identify the parent function.
The graph of the data set resembles the shape of a linear parent function $f(x) = x$.

Step 3 Estimate the cost for 5 months of online service.
The linear graph indicates that the cost for 5 months of online service is \$72.

The graph is identical to the one in the previous block, showing a linear relationship on a coordinate plane with 'Time (mo)' on the x-axis and 'Cost (\$)' on the y-axis.

1-9 Introduction to Parent Functions

Lesson Quiz: Part I
Identify the parent function for g from its function rule. Then graph g on your calculator and describe what transformation of the parent function it represents.

1. $g(x) = x + 7$
linear;
translation up 7 units

The graph shows a coordinate plane with a straight line passing through the y-axis at 7. The line has a positive slope of 1, representing the function $g(x) = x + 7$.

1-9 Introduction to Parent Functions

Lesson Quiz: Part II
Identify the parent function for g from its function rule. Then graph g on your calculator and describe what transformation of the parent function it represents.

2. $g(x) = x^2 - 7$
quadratic;
translation down 7 units

The graph shows a coordinate plane with a parabola opening upwards. The vertex of the parabola is at (0, -7), representing the function $g(x) = x^2 - 7$.

1-9 Introduction to Parent Functions

Lesson Quiz: Part III

3. Stacy earns \$7.50 per hour. Graph the relationship from hours to amount earned and identify which parent function best describes it. Then use the graph to estimate how many hours it would take Stacy to earn \$60.

linear: 8 hr
